

The Kumbh doesn't have an information problem. It has a *coordination* problem.

Information exists across the mela — **but it does not reliably become coordinated action.**

Kumbh Setu — the *field-to-control-room* response layer for mass gatherings.

Setu AI helps people understand and act. **Kumbh Pulse** helps the control room understand what is happening. Prototype runs on synthetic / simulation data.

Validated on the bench. *Ready for the field.*

DEMONSTRATED IN THE PROTOTYPE

- ✓ 41 / 41 AI evaluation cases passed
- ✓ Multilingual translation, live in the flow
- ✓ Complete incident lifecycle, report → resolution
- ✓ Ground-report corroboration before escalation
- ✓ Explainable Kumbh Pulse signals (model **pulse-rule-v0.3**)
- ✓ Human confirmation on every high-impact action
- ✓ Role-separated Pilgrim / Volunteer / Management workflows

NEXT: A CONTROLLED PILOT

10–50 volunteers · 1–2 zones

One zone, one workflow, measured end to end.

report creation time	translation turnaround
report → acknowledgement	dispatch time
resolution completion	duplicate reports
AI errors / abstention	

- Current prototype uses synthetic / simulation data. Field validation is the next step.

What we need from *Kumbhathon*.

01

Field access

Volunteers and a live zone to observe the real reporting flow.

02

Approved data access

Anonymized / approved feeds, including relevant Nashik Monitor signals.

03

Stakeholder validation

Time with departments and control-room staff to pressure-test the workflow.

04

A pilot pathway

One zone, one workflow, a measurable path to a controlled pilot.

Give us the opportunity to validate Kumbh Setu in the field — not just on a laptop.
